$\mu$

Sampling rate 2 s, recording time $1\frac{5}{\text{min}}$

30 instances → some numbers of decays X

histogram plotted ↑

Sampling rate 10 s, recording time $1\frac{5}{\text{min}}$

6 instances → some number of decays X

histogram plotted ↑

3 trials of 30 sec → 2 s sampling rate.

3 mini-experiments here to figure stuff out:

1) Vary total time recorded
   - distance source constant
   - sampling rate constant

extract poisson stats and shit

2) Vary sampling rates

- time
- distance

3) Vary distance

- time
- sampling constant

Just extract poisson math and fuck around to talk about Poisson math

4) Change bin size

Compare poisson gaussian stats.
